FindIt — API Documentation

HTTP routes, request details, and response documentation

1. Purpose

This document describes how to document the HTTP routes exposed by FindIt. The routes below are illustrative only and must be replaced or confirmed against the actual mappings in HomeController.java.

2. Endpoint Reference

Method	Example endpoint	Purpose	Status
GET	/	Display home page or dashboard	Verify in code
GET	/items	Display/retrieve items, if implemented	Illustrative
POST	/items	Submit item information, if implemented	Illustrative

3. What to Record for Each Route

• HTTP method and URL
• Purpose and controller method
• Request parameters, path variables, or form fields
• Validation rules
• Response view or response data
• Expected success and error outcomes

4. Web Endpoints vs REST APIs

If a controller returns Thymeleaf template names, document these as web routes and form submissions. Only describe an endpoint as a REST API when the application actually exposes an API response, such as JSON. Do not claim that Postman or REST APIs were used unless they were implemented or tested.

5. Verification Checklist

Inspect each @GetMapping, @PostMapping, @PutMapping, @DeleteMapping, @RequestMapping, and related handler in the actual controller. Record the exact paths and methods before submission.
